

Specification Amendments:

Please amend the Abstract as follows:

The machine for merging batches of objects, in particular batches (L1, L2) of mail items (A) previously ordered according to their order of distribution in the mailman's round, so as to constitute a single batch of mail items which is ordered according to the mailman's round comprises: a) destacking units (D1, D2), b) linked to the exit of each destacking unit, one or more dynamic-storage magazines (M11-M22) in each of which the items are moved in series around a storage loop, and interposed between each destacking unit and a dynamic-storage magazine, a device (DL1, DL2) for reading a classifying cue on each destacked object; c) a conveyor (CS) in which ~~said~~ the mail items are moved in series and to which the dynamic-storage magazines are linked in parallel, d) a control/command unit (U) for the destacking units and for the dynamic-storage magazines which, on the basis of the classifying cues read by the reading devices, controls the transferring of the mail items from the destacking units to the dynamic-storage magazines and then from the dynamic-storage magazines to the conveyor.
